#### Interference

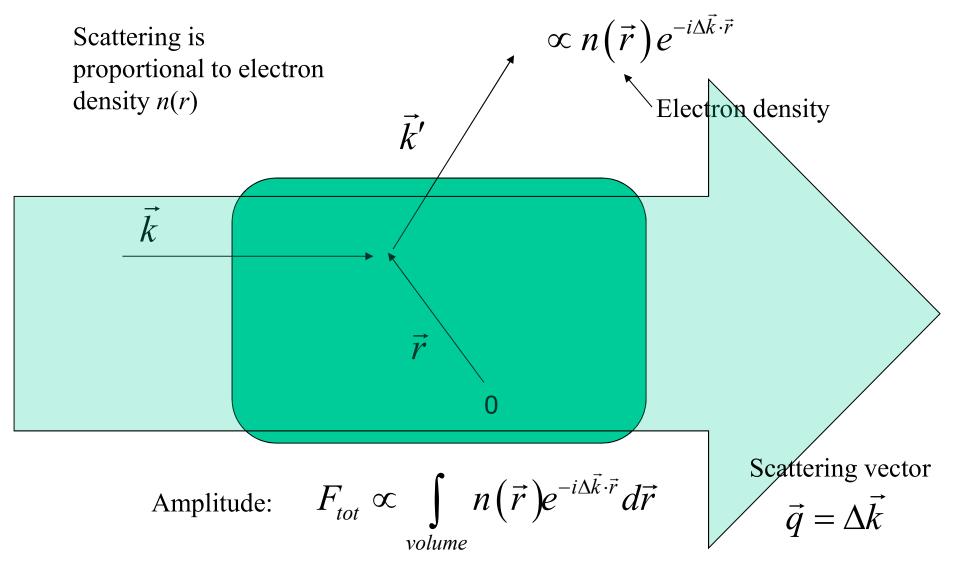

## Using complex numbers to describe oscillations

#### Interference

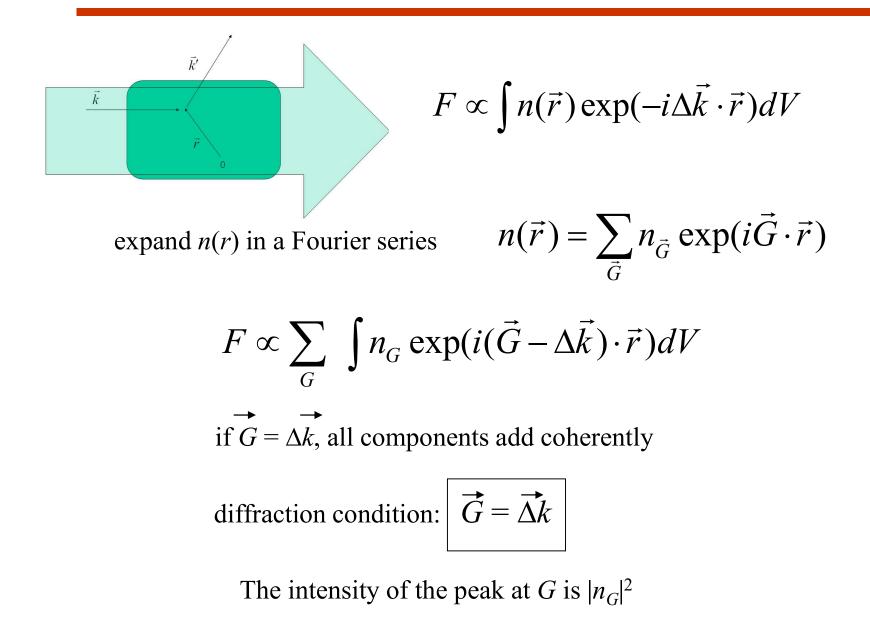

### Interference

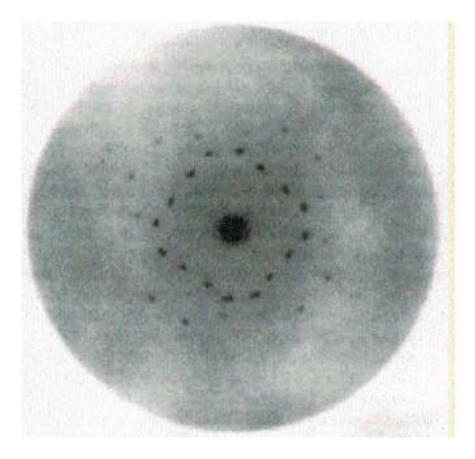

The scattering amplitude is proportional to the Fourier transform of the electron density.

## Scattering amplitude

# nobel prize 1914

first diffraction experiment of Max von Laue 1912 ZnS single crystal, exposure time 30' the 5<sup>th</sup> diffraction pattern

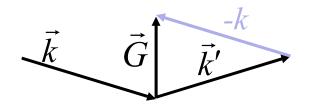

#### M. von Laue (1879-1960)

$$\vec{G} = \Delta \vec{k}$$

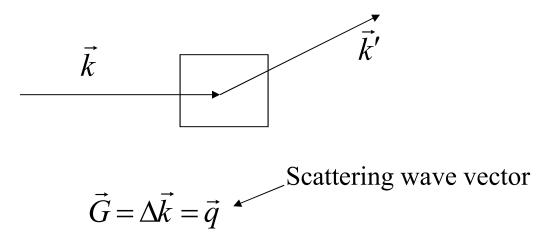

### Diffraction condition (Laue condition)

$$\vec{k'} - \vec{k} = \Delta \vec{k} = \vec{G}$$

 $|\vec{k}| = |\vec{k'}|$  for elastic scattering

## Single crystal diffraction

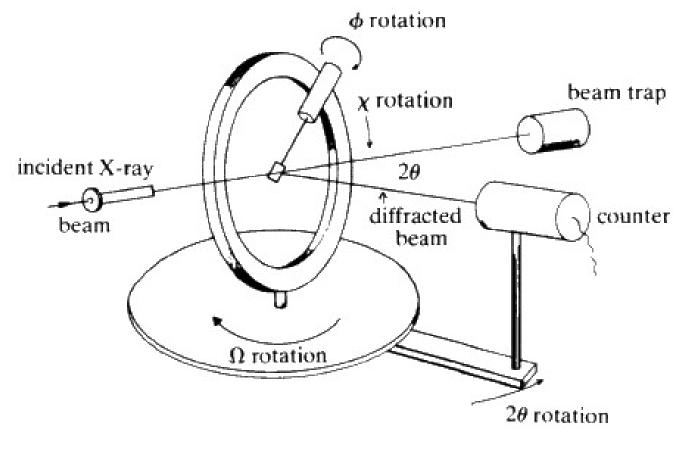

Every time a diffraction peak is observed, record G. When many G vectors are known, determine the reciprocal lattice.

The sample and the detector must be turned to find all of the diffraction peaks.

Gx	Gy	Gz	$ n_G ^2$
2.4E10	2.4E10	0	10341
2.4E10	0	2.4E10	9989

$$n(\vec{r}) = \sum_{\vec{G}} n_{\vec{G}} \exp(i\vec{G}\cdot\vec{r})$$

 $\theta$  sets the length of the scattering vector

#### Determining real space primitive lattice vectors

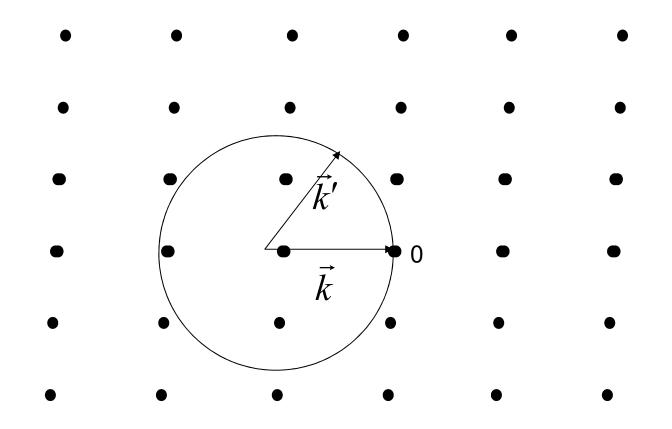

$$\vec{a}_1 = 2\pi \frac{\vec{b}_2 \times \vec{b}_3}{\vec{b}_1 \cdot (\vec{b}_2 \times \vec{b}_3)}$$
$$\vec{a}_2 = 2\pi \frac{\vec{b}_3 \times \vec{b}_1}{\vec{b}_1 \cdot (\vec{b}_2 \times \vec{b}_3)}$$
$$\vec{a}_3 = 2\pi \frac{\vec{b}_1 \times \vec{b}_2}{\vec{b}_1 \cdot (\vec{b}_2 \times \vec{b}_3)}$$

 $\vec{b_1}, \vec{b_2}, \vec{b_3}$  determined from diffraction experiment

Volume of the primitive unit cell  $\vec{a}_1 \cdot (\vec{a}_2 \times \vec{a}_3)$ 

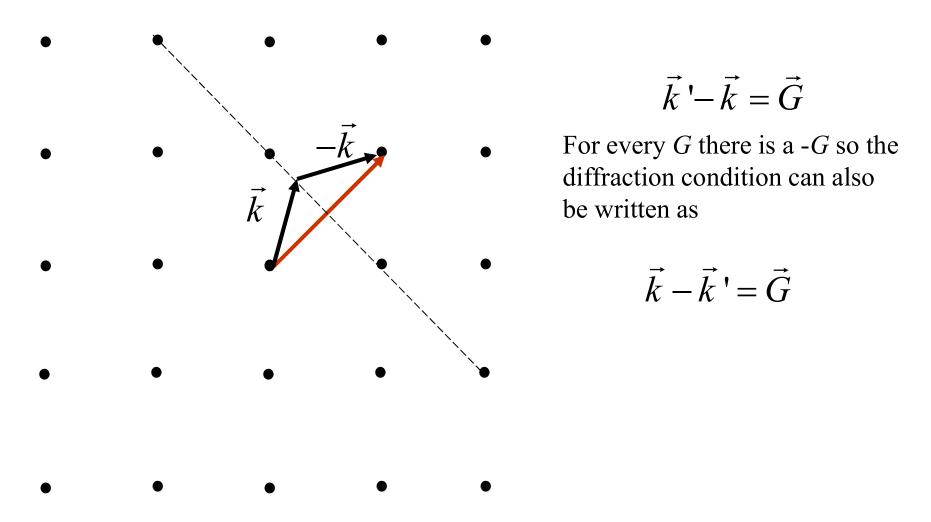

G vectors specify the Bravais lattice.

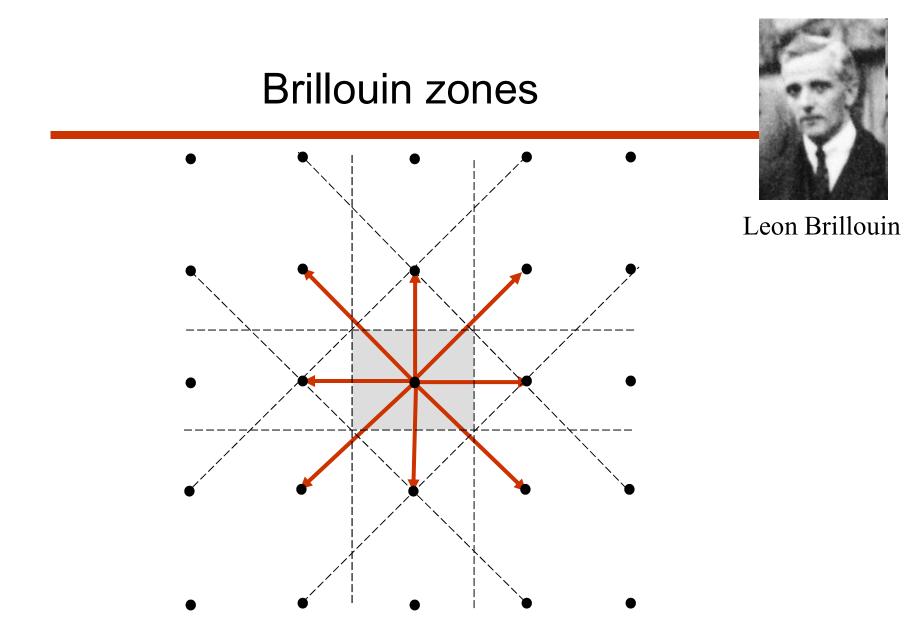

Draw a vector representing the incoming radiation so that it ends at the origin. As the crystal is rotated around the origin, the condition for diffraction will be satisfied every time a reciprocal lattice point is on the sphere.

## **Diffraction condition**

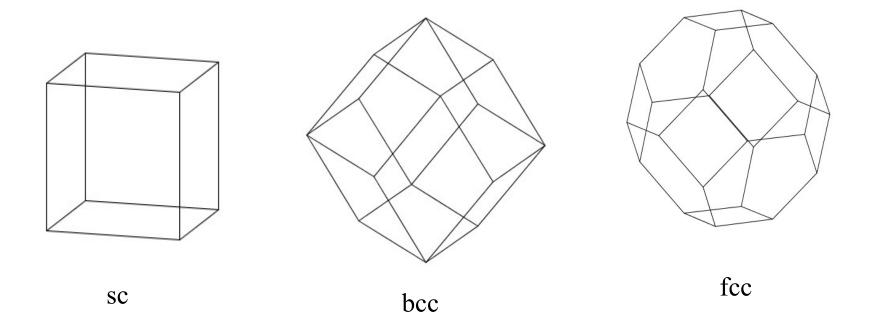

a wave will be diffracted if the wave vector ends on one of the planes

1st Brillouin zone consists of the *k*-states around the origin that can be reached without crossing a plane.

# 1st Brillouin zones

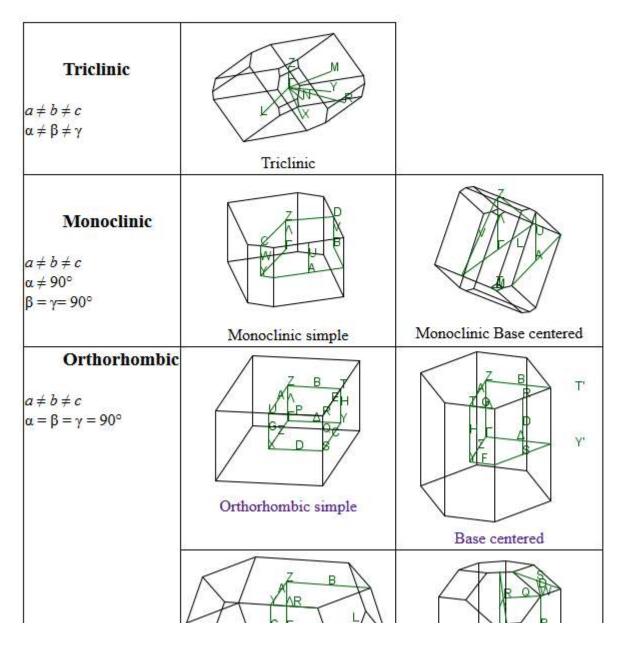

#### 1st Brillouin is the Wigner-Seitz cell in reciprocal space.

~

#### **Brillouin zones**

## Electron density of an atom

Most of the electrons are concentrated around the nucleus. The integral over the electron density is proportional to the number of electrons.

$$n_j(\vec{r}) \propto \exp\left(-\frac{\left(\vec{r}-\vec{r}_j\right)^2}{r_0^2}\right)$$

Approximately a Gaussian centered at  $r_i$ 

#### Electron density

Write the electron density as a Fourier series

$$n(\vec{r}) = \sum_{\vec{G}} n_{\vec{G}} e^{i\vec{G}\cdot\vec{r}} = \sum_{\vec{T}} \sum_{j} n_{j} \left(\vec{r} - \vec{r}_{j} + \vec{T}\right),$$
  
Translation of atom *i* of the basis

position of atom j of the basis

on vector

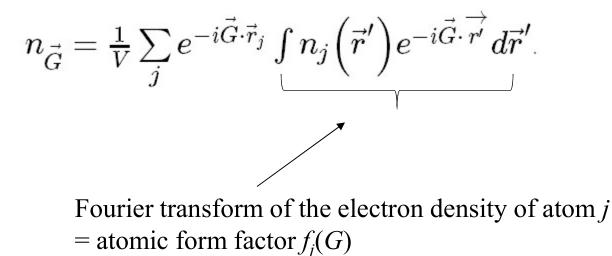

Multiply by  $e^{-i\vec{G}'\cdot\vec{r}}$  and integrate over a unit cell.

$$\sum_{\vec{G}} \int_{\mathbf{u.c.}} n_{\vec{G}} e^{i\vec{G}\cdot\vec{r}} e^{-i\vec{G}'\cdot\vec{r}} d\vec{r} = \sum_{j} \int_{\mathbf{u.c.}} n_j (\vec{r}-\vec{r}_j) e^{-i\vec{G}'\cdot\vec{r}} d\vec{r}.$$

#### **Electron density**

$$n_{\vec{G}}V = \sum_{j} \int n_{j} \left(\vec{r} - \vec{r}_{j}\right) e^{-i\vec{G}\cdot\vec{r}} d\vec{r}$$

Make a substitution  $\vec{r}' = \vec{r} - \vec{r}_j$ .

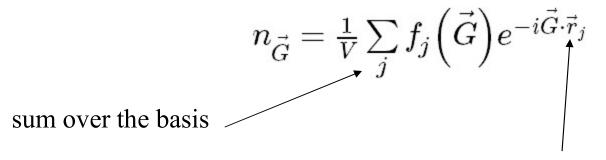

### Atomic form factor

$$f_j\left(\vec{G}\right) = \int n_j\left(\vec{r}\right) e^{-i\vec{G}\cdot\vec{r}} d\vec{r},$$

The atomic form factors can be looked up in a table.

The structure factors are given in terms of the atomic form factors.

position of atom *j* of the basis

#### Atomic form factors

In the range of scattering vectors between  $0 \le q \le 25 \text{ Å}^{-1}$ , the atomic form factor is well approximated by the expression, [1]

$$f(q) = \sum_{i=1}^{4} a_i \exp\left(-b_i \left(\frac{q}{4\pi}\right)^2\right) + c_i$$

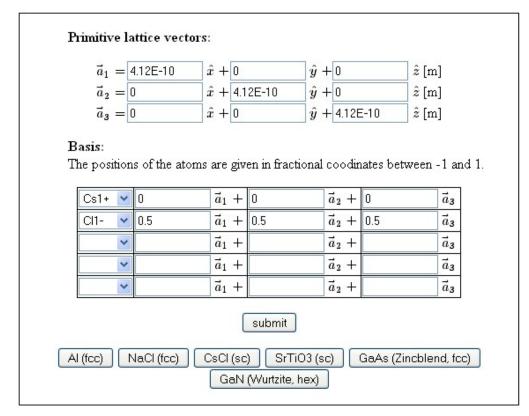

where the values of  $a_i$ ,  $b_i$ , and c are tabulated below. The different atomic form factors for the elements can be plotted using the form below.

### Structure factor

$$n_{ec{G}} = rac{1}{V} \sum_j f_j(G) e^{-iec{G}\cdotec{r}_j}$$

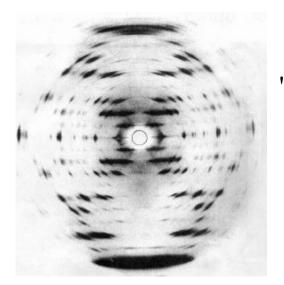

A structure factor is the Fourier transform of the electron density of the basis of a crystal evaluated at a reciprocal lattice vector. Since the electron density of the basis can be approximated as a sum over the electron densities of the atoms in the basis, the Fourier transform of the electron density of the basis is a sum of the Fourier transforms of the electron densities of the atoms in the basis.

An x-ray experiment measures the scattered intensity  $|F_G|^2$ . The phase information is lost. This is proportional to  $|n_G|^2$ .

Compare  $|n_G|^2$  to the measurements

From the atomic form factors, calculate the 7 structure factors  $n_G$ .

$$n(\vec{r}) = \sum_{\vec{G}} n_{\vec{G}} \exp(i\vec{G}\cdot\vec{r})$$

# x-ray diffraction

The shape and the dimensions of the unit cell can be deduced from the positions of the Bragg reflections; the content of the unit cell, on the other hand, must be determined from the intensities of the reflections.

Solid State Physics, Ibach and Lüth

Diffraction condition: 
$$\Delta \vec{k} = \vec{G}$$

The intensity of the peaks is proportional to the squared Fourier coefficients of the electron density.

$$n(\vec{r}) = \sum_{\vec{G}} n_{\vec{G}} \exp(i\vec{G}\cdot\vec{r})$$
