Measure reciprocal lattice vectors from  $\Delta\vec{k} = \vec{G}$

Find the primitive reciprocal lattice vectors

$$\vec{G} = h\vec{b}_1 + k\vec{b}_2 + \ell\vec{b}_3$$

Determine the Bravais lattice

$$\vec{a}_1 = 2\pi \frac{\vec{b}_2 \times \vec{b}_3}{\vec{b}_1 \cdot (\vec{b}_2 \times \vec{b}_3)}$$

$$\vec{a}_2 = 2\pi \frac{\vec{b}_3 \times \vec{b}_1}{\vec{b}_1 \cdot (\vec{b}_2 \times \vec{b}_3)}$$

$$\vec{a}_3 = 2\pi \frac{\vec{b}_1 \times \vec{b}_2}{\vec{b}_1 \cdot (\vec{b}_2 \times \vec{b}_3)}$$

# Powder diffraction

Powder diffraction is performed on a powder of many small crystals. Ideally, every possible crystalline orientation is represented equally in a powdered sample. The relative intensities of the diffraction peaks indicate which crystal structures are present.

X-rays: Bragg diffraction

# Powder diffraction

For powder diffraction, a crystal is ground into a fine powder so that there are many small crystals with random orientations. X-rays strike the surface of the sample at an angle  $\theta$  and an x-ray detector is placed at an angle  $\theta$  to the surface. Only planes parallel to the surface will diffract x-rays to the detector.

Since there are many small crystals with random orientations in the sample, all possible crystal planes that can diffract the x-rays will contribute to the measured signal when  $\theta$  satisfies the Bragg condition. The form below can calculate the powder diffraction pattern for any crystal with up to five atoms per primitive unit cell. Some buttons are provided that load the form with the data for certain crystals.

**Primitive lattice vectors:**

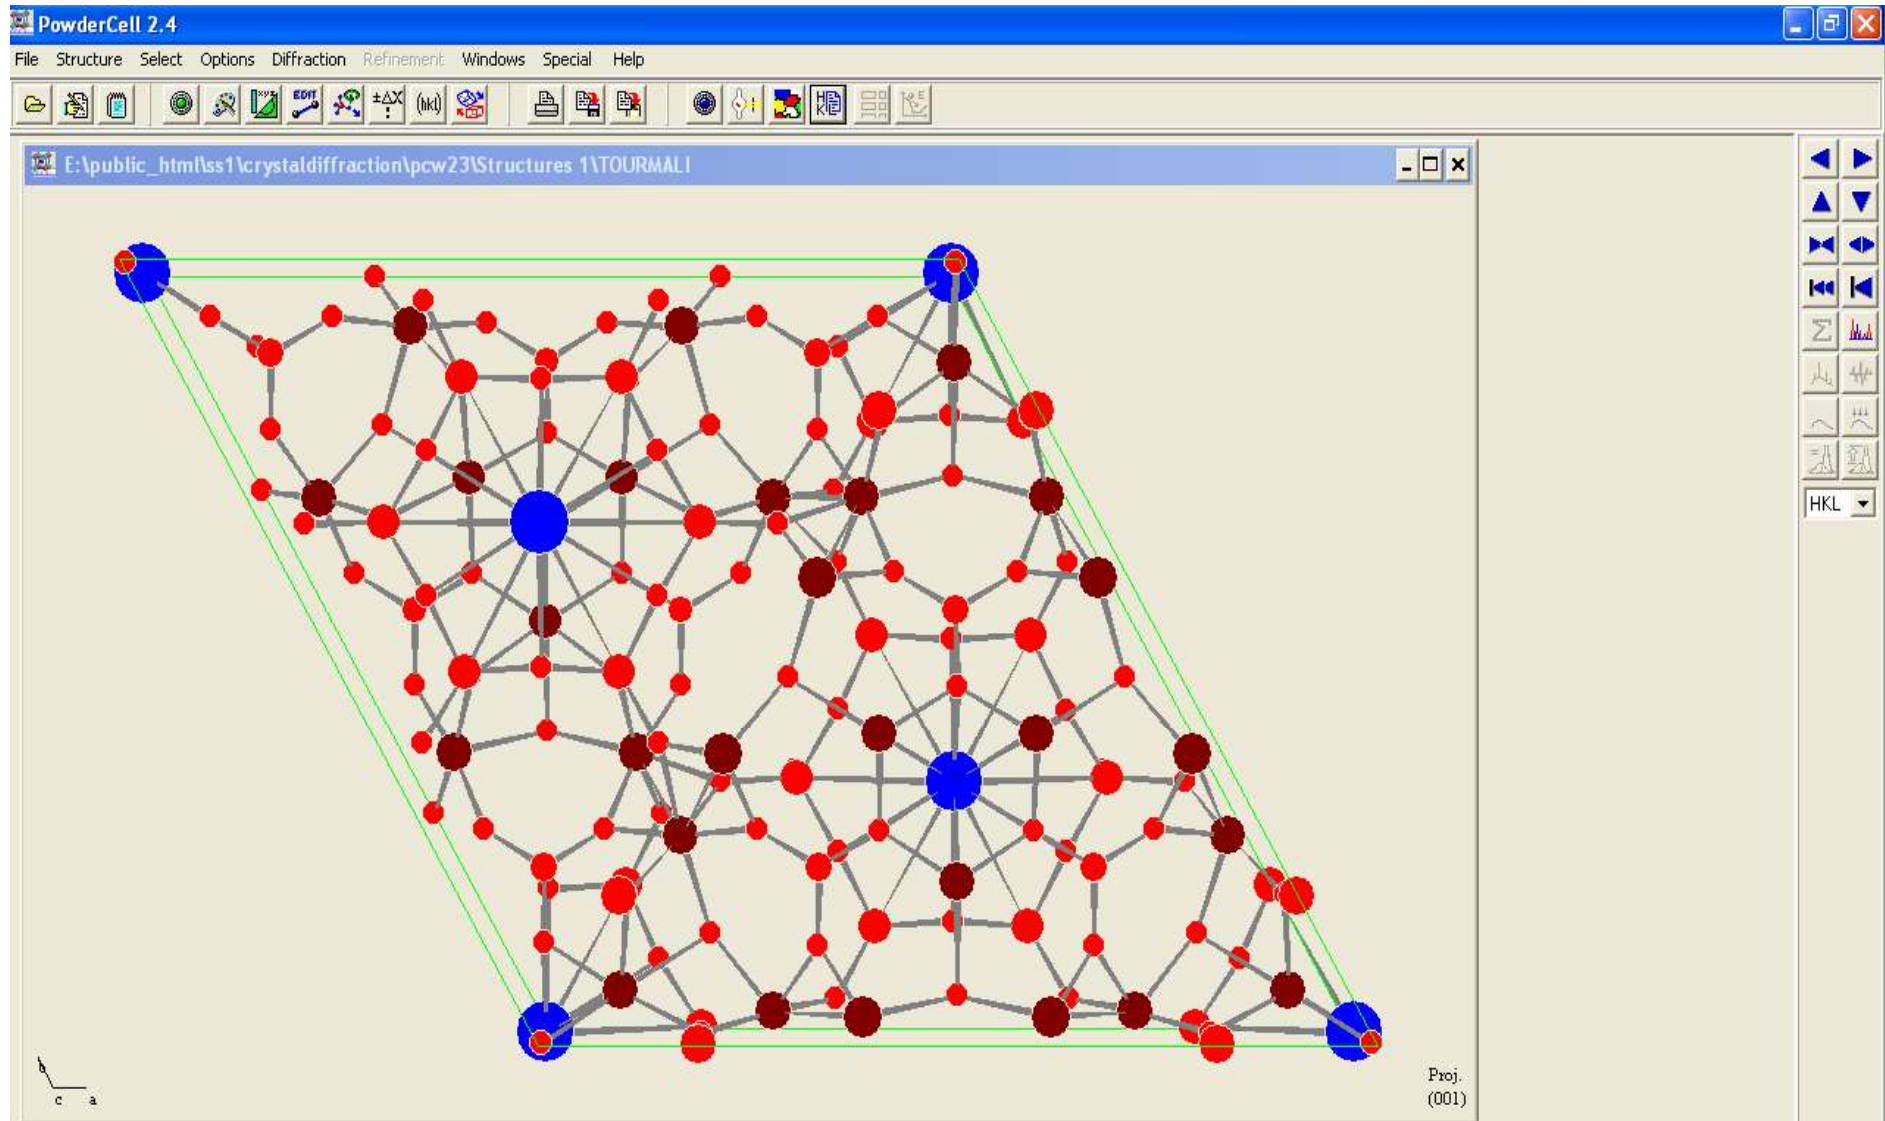

$\vec{a}_1 =$    $\hat{x} +$    $\hat{y} +$    $\hat{z}$  [m]  
 $\vec{a}_2 =$    $\hat{x} +$    $\hat{y} +$    $\hat{z}$  [m]  
 $\vec{a}_3 =$    $\hat{x} +$    $\hat{y} +$    $\hat{z}$  [m]

**Basis:**  
 The positions of the atoms are given in fractional coordinates between -1 and 1.

---

## **Phase identification**

Every crystal has a specific "fingerprint" given by the positions and intensities of the diffraction peaks. The composition of a multi-phase specimen can be determined by fitting its diffraction pattern to the diffraction patterns of pure crystals which can be looked up in a database.

**International Centre for Diffraction Data**    [www.icdd.com](http://www.icdd.com)  
550,000 reference materials

Phase transitions, thermal expansion, piezoelectricity, piezomagnetism, bulk modulus, compliance tensor can be measured.

# Electron diffraction in a TEM

---

The wavelength of the electrons is typically much smaller than the lattice spacing. The diffraction peaks in the plane perpendicular to  $k$  are observed.

## Electron diffraction

In electron diffraction, the intensity of a diffraction peak at reciprocal lattice vector  $\vec{G}$  is the square of the structure factor,  $n_{\vec{G}}$ .

$$n_{\vec{G}} = \frac{1}{V} \sum_j f_j(\vec{G}) e^{-i\vec{G} \cdot \vec{r}_j} = \frac{1}{V} \sum_j f_j(\vec{G}) \left( \cos(\vec{G} \cdot \vec{r}_j) - i \sin(\vec{G} \cdot \vec{r}_j) \right)$$

Here  $V$  is the volume of the primitive unit cell,  $j$  sums over the atoms in the basis,  $\vec{r}_j$  are the positions of the atoms in the basis, and  $f_j(\vec{G})$  are the electron atomic form factors evaluated at  $\vec{G}$ .

The form below calculates the electron structure factors based on this formula. The crystal structure is specified by providing the primitive lattice vectors and the positions of the atoms in the basis. A basis of up to five atoms can be calculated. The script first calculates the primitive reciprocal lattice vectors and from them calculates the reciprocal lattice vectors  $\vec{G}_{hkl} = h\vec{b}_1 + k\vec{b}_2 + l\vec{b}_3$ .

On this page, the direction of the incoming electrons is given in terms of the primitive lattice vectors in reciprocal space,  $H\vec{b}_1 + K\vec{b}_2 + L\vec{b}_3$ . Usually the direction of the incoming electrons are given in terms of the conventional lattice vectors. Be aware that the [100] is a (usually) different direction if primitive lattice vectors are used than if conventional lattice vectors are used.

# Neutron diffraction

---

Typically a nuclear reactor is used as the neutron source

There are different atomic form factors for neutrons than for x-rays.

Determine the positions of H in biological samples.

Can for example distinguish between Fe and Co which have similar atomic form factors for x-rays.

# Atomic beams

---

Hydrogen and Helium are used for diffraction studies

$$E = \frac{1}{2}mv^2 = \frac{p^2}{2m} = \frac{\hbar^2 k^2}{2m} = \frac{h^2}{2m\lambda^2}$$

Low energies can be used for delicate samples.  
Measure the surface like LEED.

# Student projects

---

Use the electron diffraction or LEED programs to reproduce results from the scientific literature. (To test the programs.)

Write a program that calculates the neutron diffraction or the helium scattering structure factors.

# The quantization of the electromagnetic field

---

Wave nature and the particle nature of light

Unification of the laws for electricity and magnetism (described by Maxwell's equations) and light

Quantization of the harmonic oscillator

Planck's radiation law

Serves as a template for the quantization of phonons, magnons, plasmons, electrons, spinons, holons and other quantum particles that inhabit solids.
